

# Research Study

## Smartphone-based assessment of standing and walking in healthy adults

### Study goal:

All smartphones contain small devices that continuously monitor movement. The goal of this study is to determine the potential for smartphones to monitor movements of the body when standing and walking.

### Requirements:

- Between 18-35 or 65-85 years of age
- Own an iPhone
- English speaking
- Able to stand and walk without assistance
- Free of any major health conditions

### Procedures include:

Assessments of standing and walking.  
2 laboratory visits and 3 at-home assessments will be completed.

### Participation is paid up to \$50.
